

## **Air Source Heat Pump Enclosures from Jtech Services**

As Air Source Heat Pumps become used more often to heat homes, there is a need to protect and enclose any exposed pipework.

The Air Source Heat Pump Enclosure System from Jtech Services provides protection to any external pipework and junction valves. Designed to be adaptable to each application means that the system will be suitable for any situation.

Following the installation of the mechanical and electrical services package a site measure is taken and detailed drawings made for the client to assess before manufacture. Once approved, manufactured, and delivered it is a straightforward process to install.

If required, a client can have insulation added to the enclosure system in a range of thicknesses to suit the specific environmental conditions.

Whilst this project was finished in a standard black powder coat finish, Jtech Services can also offer their systems in a range of other colours that tie in with either new or existing décor.
