

FP McCann attends British Tunnelling Society Conference and Off-Site Exhibition in London

FP McCann has recently showcased both our **shaft and tunnel** and **architectural and structural** precast concrete products at the British Tunnelling Society conference and the Off-Site Construction exhibition, held at The Queen Elizabeth II Conference Centre, Westminster and Excel, London respectively.

FP McCann is very much involved in major tunnelling and shaft schemes in the Capital, supplying Crossrail and the London Cable Tunnels project with **precast concrete segmental shafts and tunnel linings** and with preparatory works now underway on the massive Thames Tideway Tunnel scheme, FP McCann is gearing up for this and associated works.

Organised by the British Tunnelling Society and Tunnelling Journal, FP McCann has once again given its full support along with 50 other companies to the two day programme of conferences and seminars highlighting new products, technical developments and design innovations.

Speaking on behalf of FP McCann's tunnelling and shafts division, **National Tunnelling Products Manager, Stuart Carson** says, "**As our Tunnels and Shafts division has expanded, we are actively involved across the UK in a number of high profile**

projects in the tunnelling and shaft sinking sectors. The BTS conference has helped us to reinforce the message that FP McCann is now a leading supplier of segmental tunnels and shafts with the manufacturing capability to service major contracts throughout the UK"

At Excel, FP McCann has been promoting its [structural and architectural precast concrete](#) business featuring the extensive range of precast modular architectural building solutions and components now available and used on projects including; schools, student accommodation, hotels and apartment blocks.

FP McCann now specialises in manufacturing 'grey' concrete panels which are subsequently clad by the main contractor. These panels are used to create off-site precast modular building structures including internal walls, floors and ceilings all manufactured to a high quality finish. Additionally, and in the same market sectors, FP McCann has expanded into the specialist architectural facade finishes, offering '[sandwich panels](#)' clad with either a brick-facing or acid-etched design specification. Other architectural precast concrete products complementing the 'sandwich panels' include lintels, columns, soffits, balconies and stairs.

Increasingly, architects and designers are choosing off-site manufactured modular room systems for the quality of finish, speed of construction and safe on-site installation practices they offer. Design teams at FP McCann work closely with the client and contractor to ensure the precast modular room dimensions and build criteria match the design specifications.
