Frédéric Moirault (Project Manager)

A residential development offering contemporary apartments and penthouses designed for metropolitan living. This modern development required high quality landscaped areas with secured by design cycle parking to link with the building's facade. We provided a selection of sedum roof cycle shelters, that not only met the planning requirements, but also offered a secure cycle parking facility that enhances the external space. The green roof timber shelters link the cladding of the building to the outside space and allow a soft transition when viewing from the courtyard from the surrounding balconies.

To compliment the cycle parking, a range of curved benching units were also fitted to allow the residents to interact with the external space. A large pergola was fitted to create an additional external seating area that is a little more secluded. As the planting scheme grows the timber pergola will naturally blend more into its surroundings and enhance the structure to provide more shade and privacy. The street furniture package works perfectly alongside the building and creates a functional external solution, whilst never compromising the high design standard of this urban village in the centre on London.
