

## New for 2023 – Container Shelters

We are pleased to announce the arrival of a new product offering to our bespoke temporary building portfolio, container shelters.

These popular shelters are a fantastic option for creating fast and easy covered outdoor workspace & storage areas. At Stuart Canvas we can produce both standard width & length container shelters and complete custom-made solutions to fit your shelter requirements. Our standard shelters span between two containers (12m length), these create a cost-effective and versatile structure

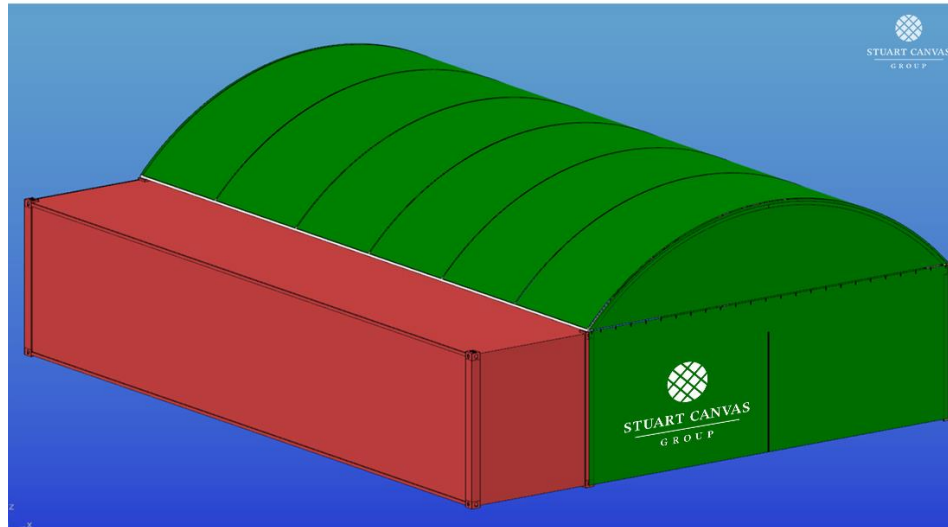

We can offer a complete installation service for all our container shelter options to save you the time & hassle of erecting the shelter, all you need to do is supply the containers.

Container Shelter Open at Both Ends Design Concept by Stuart Canvas

Our container shelters are made from galvanized steel, which unlike the tubular steel that many pre-made kits are manufactured from. Our steel structure provides extra durability and high wind-loading tolerances. We can use both 650gsm & 900gsm heavy-duty PVC fabric to span our steelwork. This can either be as a single piece to span the shelter for a cost-effective solution, or we can use Kedar panels which create higher durability and extra ease of use when replacing a single panel in case of damage vs a replacing complete single sheet.

Our container shelters can be manufactured with front and rear panels to enclose the whole area to protect against inclement weather.
