

Mesh Computer Security Cages

We supply a wide variety of mesh Computer security cages from complete server room cages to small sliding access doors within a room, This particular project was just for a sliding door across opening that had the customers server inside, although this was inside another room the customer didn't want anyone accessing this apart from the internal IT team so we created a sliding access door with handle and sliding door gear within the tight space.

The cages were fitted with a sliding door as not to limit access with swinging doors. The security cages can be supplied with swinging doors as well as roller shutter doors if required. As well as access control systems linked to your own on site systems.

The mesh Computer Security cage was 2.2m high and was made using some standard system parts as well as some bespoke items, but they can be easily incorporated into each other as they are all based around a standard system.

The mesh security cage was delivered to Wokingham and our installers carried this through the building to the server room area, the install time was 1 day for 2 guys and finished in standard Anthracite Grey and standard mesh 25mm x 25mm, these can also be supplied in 50mm x 50mm mesh, expanded metal, half solid half mesh, all solid panels if required.
