

Mesh Security Cages

We have supplied and installed these mesh security cages on a concrete mezzanine floor area at Biggin Hill Airport, the customer was originally storing products on this floor Area, but had concerns that items stored on this floor could easily be stored higher than the existing wall at 1200mm and knocked over onto crew below, so we went through the products and areas with the customer and what they wanted to store up there, we divided the area into a number of different sized cages allowing for different departments to have their own cages and lock the materials away.

The cages were fitted with a sliding doors to give as larger security cage as possible and not to limit access with swinging doors. The security cages can be supplied with swinging doors as well as roller shutter doors if required. As well as access control systems linked to your own on site systems.

The mesh cage along the edge of the floor was 3m high and the internal cages where to the standard height of 2.44m, the systems can be easily incorporated into each other as they are all based around a standard system.

The mesh security cage was shipped down to Biggin Hill Airport and with the help of the customers onsite goods lift the cages where moved from the ground floor up on the mezzanine floor 8m up, the install time was 4 days for 2 guys and finished in standard light Grey and standard mesh 50mm x 50mm, these can also be supplied in 25mm x 25mm mesh, Expanded metal, half solid half mesh, all solid or with mesh hatches for loading through as a store room.
