

Ceramic Tile Protectors

Distribution and shipping issues can manifest themselves in many ways creating untold stress for any retail network. But when you're distributing large ceramic tiles nationwide with a high-ticket value, minimal damages is preferable. Barkston had a low-cost, practical solution to address all their issues.

The brief was that current packaging employed (cardboard and polystyrene) alone was simply inadequate due to the sizes and weights concerned and merchandise was arriving in poor condition due to chipping and breakages which would then be rejected with huge cost implications.

Made from re-usable Polyethylene, these robust corner protectors simply slip on to all four corners of these large ceramic tiles protecting the most vulnerable edges from chips and cracks.

This relatively inexpensive item was fabricated here at Barkston's, printed from one of their dedicated 3D printers which is ideal for prototyping and small batch ordering of components, a fast growing in-demand service here.

Using a robust material like Polyethylene ensured that it was up to the job, could be re-used many times and damages could now be minimal giving peace of mind to our clients whilst not interrupting their distribution network.
