

The single skin all steel partitioning system was installed into an old warehouse facility in Irlam near Manchester. The partitioning went to the full height of the warehouse on 2 sides and followed the offset apex of the building, showing that the partitioning system and ne modified on site to suit your requirements and building structure.

On the 3rd side the customer wanted a corridor to a fire door keeping in there with a suspended ceiling as well as a fire door at that end of the partitioning for access out in an emergency.

Within the corner of the newly created secure warehouse area the customer also required a small warehouse office to allow staff to work and store product in of value. This also had a single access door into the office which is lockable and a suspended ceiling over the top, the customer will organise the lighting in there as well as the emergency lighting.

In the end of the Single skin partitioning there was 1 double swinging door for access through with a pallet truck as and when they need to bring product in there, if space was an issue we could have installed a sliding door instead.

This project was installed over 4 days by 3 men in Irlam near Manchester.
