

Storeroom Partitioning.

This Project in Wrexham was done using the single skin steel partitioning system, coming off an existing double skin partitioning system which we had installed previously on this customers site. The customer wanted to create a secure storeroom area on a mezzanine floor and didn't need the double skin partitioning as it would be only there to be used as a storeroom area for documents and company items. It was more cost effective to do this in the standard single skin steel partitioning system rather than the double skin partitioning, but we installed the same fascia board to the top of the single skin partitioning to match up against the other system, so from a distance they looked similar in style and finish.

The panels where mainly all solid panels with a couple of windows in 2 of the panels as well as the doors, these can also me supplied as all mesh and half mesh half solid if required, lots of different variants for this system.

The install took 1 day to complete and was finished in Standard white RAL 9010 and done to the standard height of 2.44m. Other colours and heights can be supplied upon request.
